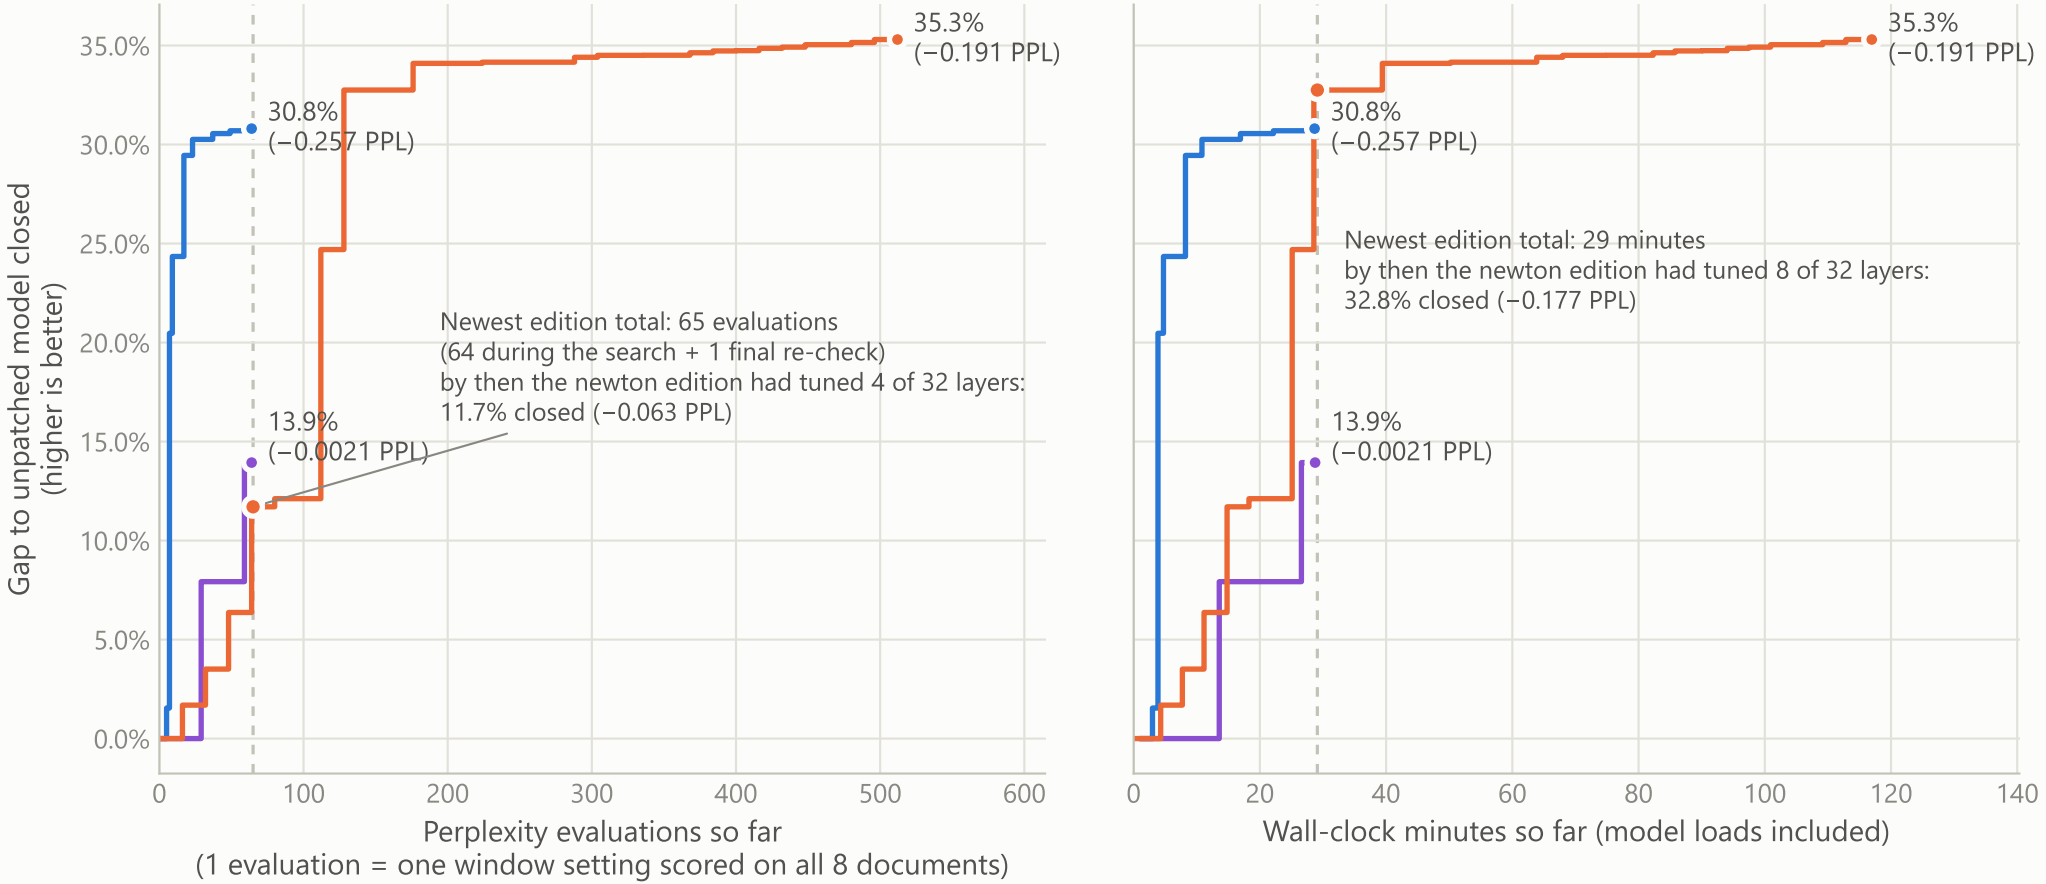
Search progress against cost

Each line is one pass over all 32 layers. Each step up is a layer whose window the search changed. Up and to the left is better.
Gap closed = (start PPL − PPL now) / (start PPL − unpatched PPL). 0% = no better than the uniform starting window, 100% = as good as the unpatched model.



Newest edition, unfixed kernel (mask leak), 2×H200
Newest edition, fixed kernel, 1×H200
newton edition (manual per-layer, Fig. 7 method), unfixed kernel, 2×H200
