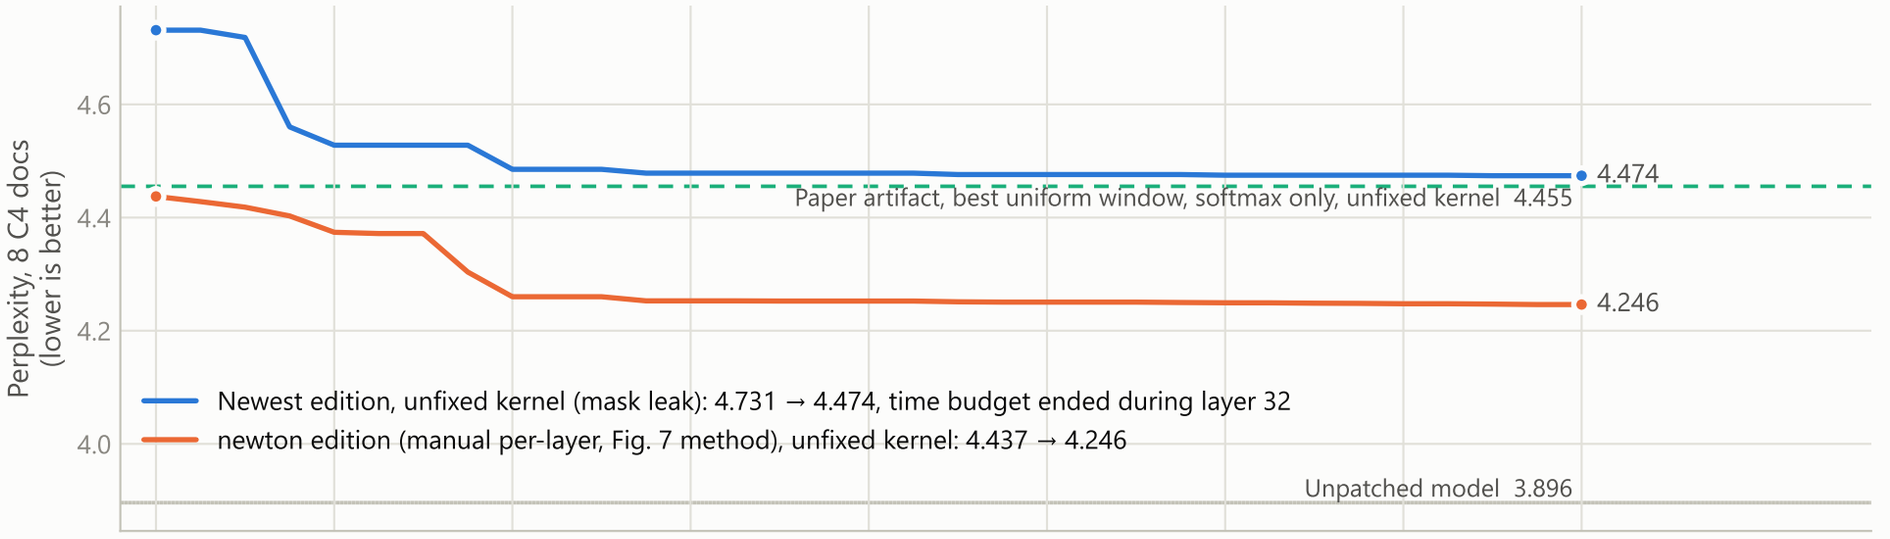
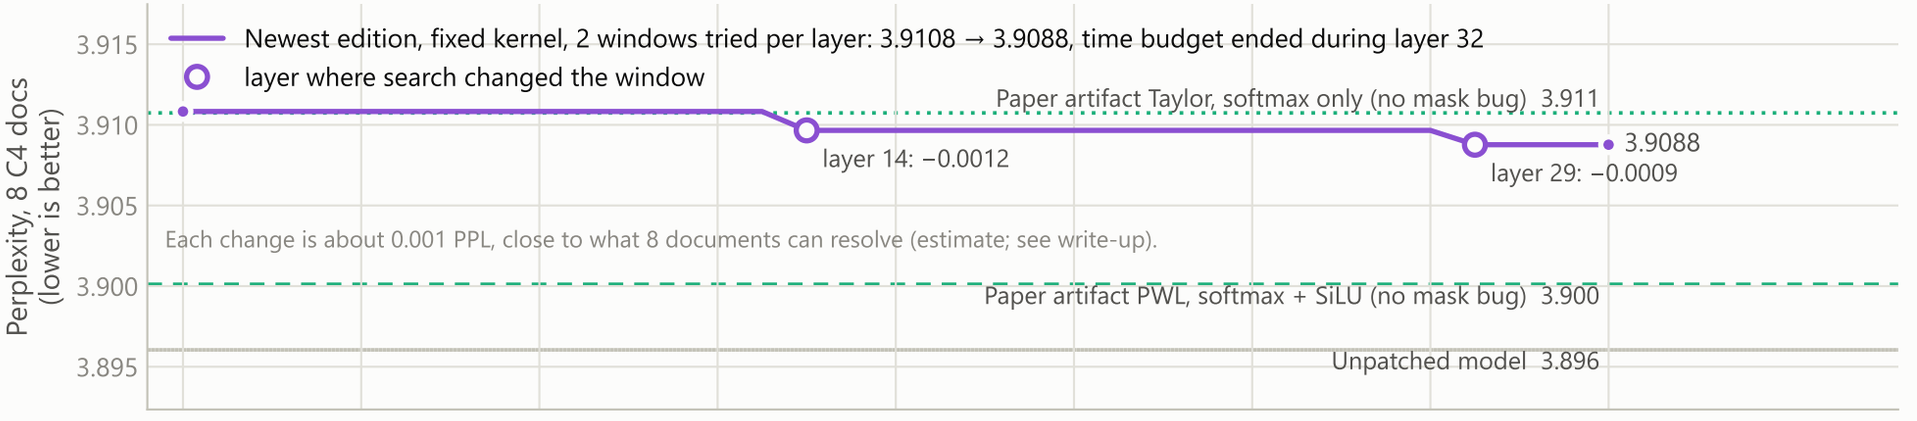
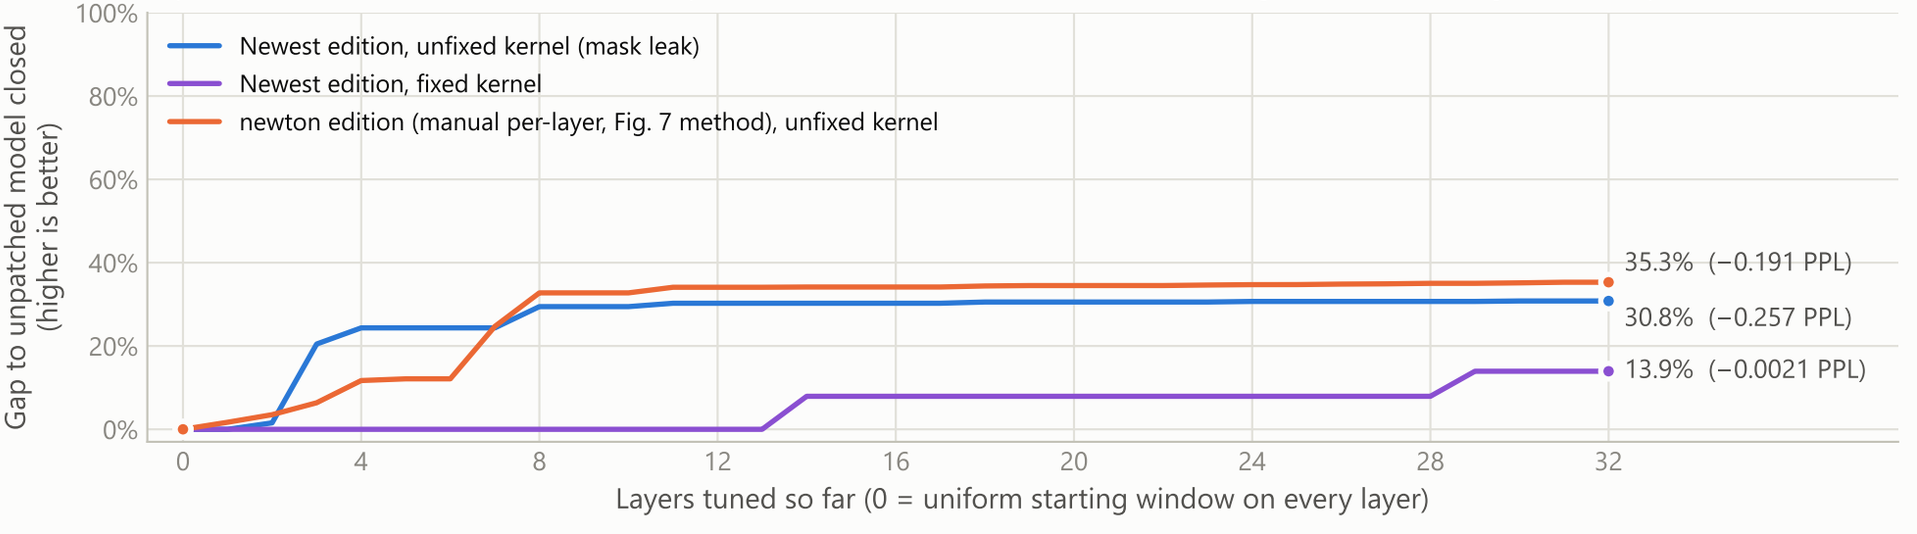
Unfixed kernel (mask leak): both runs stay 0.350 to 0.835 PPL above the unpatched model



Fixed kernel, zoomed in: starts 0.0148 PPL above the unpatched model; search removes 0.0021



All runs on one scale: share of each run's own gap to the unpatched model that search closed


Gap closed = (start PPL − PPL now) / (start PPL − unpatched PPL). 0% = no better than the uniform starting window, 100% = as good as the unpatched model.
