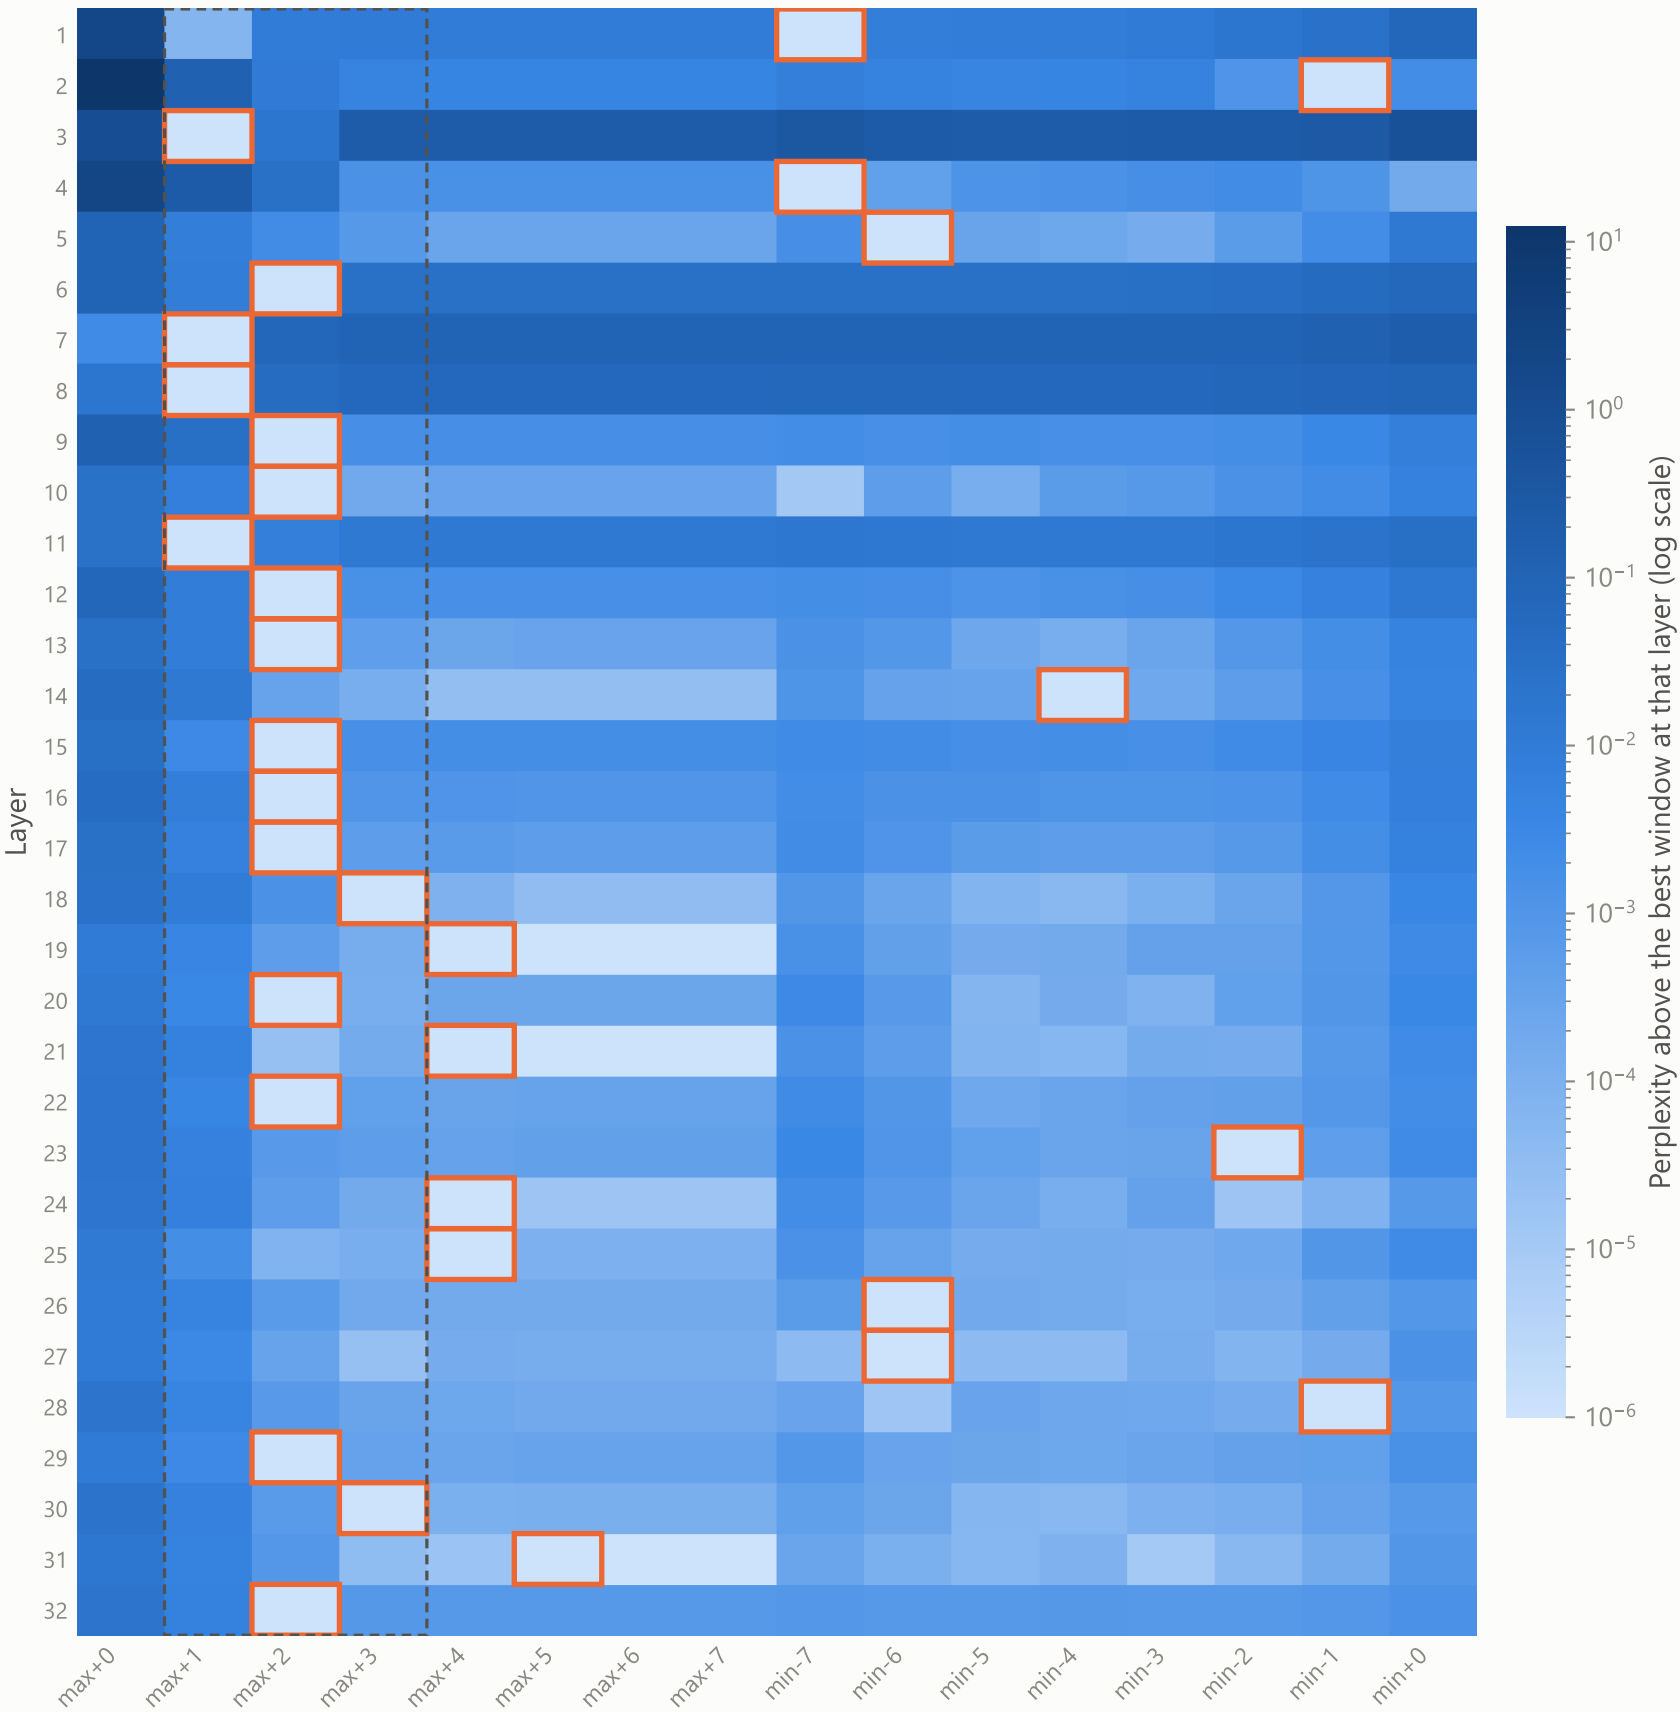
Every window the newton edition tried, per layer (unfixed kernel)

Question: at each layer, does one window clearly win, or are several about equal?
Shows: at 23 of 32 layers the runner-up is within 1e-3 PPL of the best, so the pick there is effectively a tie.



Orange = window picked. Dashed box = the Newest edition grid (max+1..max+3). Gaps under about 1e-3 are not resolvable on 8 documents (estimate).
