Question: how good is the best single window for every layer, and how do VLP, PWL and Taylor compare on the same documents?
Paper artifact uniform-window sweeps on the 8 documents: perplexity, lower is better. Best cell outlined; colour saturates at the 90th percentile; blank = above 2× the best or diverged (NaN).
VLP softmax panels and the end-to-end VLP value use the unfixed softmax kernel (mask leak), so they are inflated. SiLU, PWL and Taylor panels are unaffected.

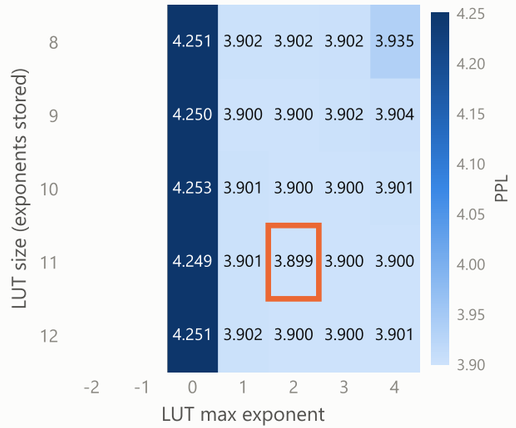

VLP softmax, max-built (best 4.455)

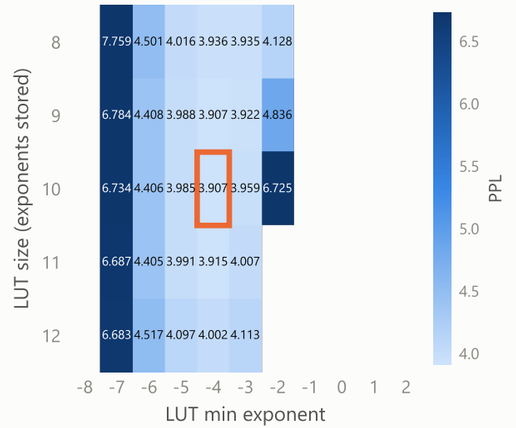

VLP softmax, min-built (best 4.862)

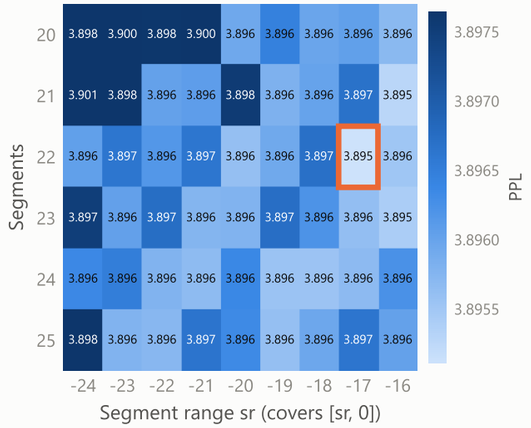

VLP SiLU, max-built (best 3.899)

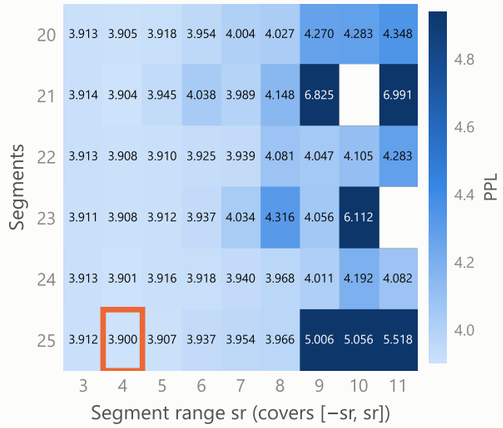

VLP SiLU, min-built (best 3.907)

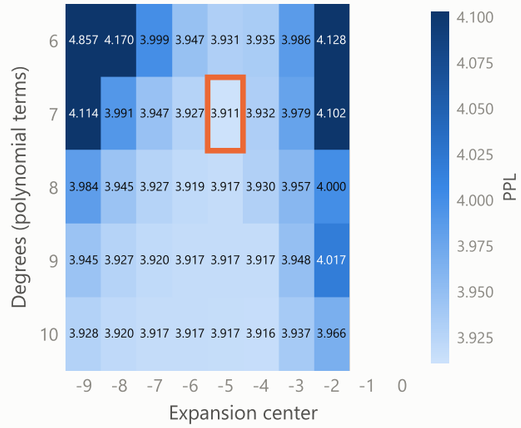

PWL softmax (best 3.895)

PWL SiLU (best 3.900)

Taylor softmax (best 3.911)

End to end (softmax + SiLU; T is softmax only)

	8 docs	Paper (100 docs)
Base	3.896	5.75
VLP	4.467	6.21
PWL	3.900	5.68
T	3.911	5.78
